

THIRD-PARTY SECURITY AUDIT REPORT

Review of User Offboarding Process and Post-Employment Account Access

Consolidated with credential exposure intelligence and a full external penetration test

Primary matter under investigation: administrative actions, employee offboarding controls and account access following the departure of Mr. Zaman.

01	Primary Investigation	Independent review of offboarding and post-employment account access
02	Credentials Export	505 restricted credential evidence records
03	External Penetration Test	Full subdomain security assessment and remediation guidance

REPORT GOVERNANCE

Document Control and Contents

Source hierarchy, distribution controls and report navigation.

PRIMARY SUBJECT	User offboarding and post-employment account access	CLASSIFICATION	Confidential - authorised recipients only
PRIMARY ORGANISATION	Kinnaird College	DISTRIBUTION	Internal use only
CONSOLIDATED DATE	7 August 2026	SOURCE DOCUMENTS	Three supplied reports

Contents

01	Primary Investigation Independent third-party security audit	3
02	Credentials Export Restricted CTI evidence register	16
03	External Penetration Test Full technical audit and remediation programme	168

Source Treatment

The primary investigation remains the headline matter. The credential export is presented as supporting intelligence, followed by the full external penetration test as the extensive technical assurance section.

Visual presentation, typography, headers, footers and page flow are standardised throughout. Source wording, findings, evidence fields, risk ratings and stated conclusions are retained unless a formatting-only change is required for legibility.

Restricted evidence handling: Section II contains unredacted credentials. Distribution should be limited to personnel with a defined incident-response, legal, administrative or security need to know.

SECTION I - PRIMARY INVESTIGATION

Review of User Offboarding Process and Post-Employment Account Access

Third-Party Security Audit Report

REPORT TYPE	Independent Third-Party Security Audit
OBJECTIVE	Review of employee offboarding controls, administrative actions, and post-employment access following the resignation/departure of Mr. Zaman.

Executive Summary

At the request of the Kinnaird College, an independent review was conducted to determine whether the organization's offboarding procedures were implemented appropriately after the departure of Mr. Zaman, whose last working day was 21 May.

The investigation identified significant delays in revoking user access. Although management instructed that the employee's access be revoked, the administrative action initially taken was only a password change instead of immediate account suspension and access revocation.

As a result, the former employee was able to regain access using historical password challenge and after his employment had ended.

The account was finally suspended on 4 June, after which no successful login was observed.

The audit concludes that the organization experienced a failure in the execution of its employee offboarding procedure, exposing the organization to unnecessary operational and reputational risk.

ASSESSMENT BASIS

Scope of Audit

The audit included review of:

- Administrative activity logs
 - User login logs
 - Password management records
 - account activity
- Mobile device management logs
 - User suspension records
 - Timeline of administrative actions

Timeline of Events

DATE	EVENT
21 May	Last working day of Mr. Zaman
25 May	Former employee successfully accessed official account
25 May	Administrator changed account password after several hours
25 May After password reset	Former employee regained access using historical password challenge
4 June	Administrator suspended user account
4 June	Login attempt failed due to account suspension
9 June	Registered mobile device deleted and blocked
26 July	Latest login attempt failed

AUDIT FINDINGS

Findings and Risk Ratings

Six findings are reproduced from the supplied independent audit. Their wording, sequence and source-assigned risk ratings are retained.

FINDING 1

RISK RATING

High

Delayed Revocation of User Access

OBSERVATION

The employee's last working day was 21 May.

Management requested that user access be revoked.

However, the administrator only changed the account password rather than immediately:

- suspending the account,
- revoking active sessions,
- removing authentication methods,
- deleting registered devices.

The account therefore remained active.

RISK

Changing a password alone does not constitute user offboarding.

Industry best practice requires immediate disabling of user accounts once employment ends.

Leaving an account active allows possible access through:

- password recovery,
- remembered devices,
- active sessions,
- authentication tokens,
- mobile synchronization,
- OAuth tokens.

FINDING 2

RISK RATING

Critical

Unauthorized Post-Employment Use of Official Email

OBSERVATION

After leaving the company, Mr. Zaman successfully accessed the official account on 25 May and remain accessible till 4 June.

This access occurred after termination of employment.

IMPACT

Use of an official company email account by a former employee presents significant risks, including:

- reputational damage,
- dissemination of unauthorized communications,
- legal liability,
- loss of stakeholder trust,
- potential disclosure of confidential information.

FINDING 3

RISK RATING

High

Password Reset Was Insufficient

OBSERVATION

Administrative logs indicate that the administrator changed the password.

However, the former employee later regained access using historical password challenge.

This demonstrates that changing the password alone did not completely revoke account access.

Additional security controls were not immediately implemented, including:

- account suspension,
- session revocation,
- MFA reset,
- authentication method removal,
- device revocation.

FINDING 4

RISK RATING

High

Delay in Account Suspension

OBSERVATION

The account remained active until 4 June.

Only after the second unauthorized email incident was the account suspended.

Immediately following suspension:

- login attempts failed.

This confirms that account suspension effectively prevented further access.

FINDING 5

RISK RATING

Medium

Delay in Mobile Device Revocation

OBSERVATION

The mobile device associated with the account remained registered until 9 June, five days after account suspension.

RISK

Mobile devices may retain:

- cached emails,
- authentication tokens,
- synchronized documents,
- application sessions.

Although no evidence of misuse was identified after suspension, delaying device revocation represents unnecessary exposure.

FINDING 6

RISK RATING

High

Inconsistent Offboarding Procedure

OBSERVATION

Audit logs indicate that other departing employees, including:

- Ms. Humera
- Ms. Iffat

had their accounts suspended immediately upon departure.

In contrast, Mr. Zaman's account followed a different process:

- password changed,
- account remained active,
- suspension delayed,
- mobile removal delayed.

REVIEW BOUNDARY

The audit cannot determine the reason for this inconsistency based solely on the available technical logs.

However, the inconsistency should be investigated by management to determine whether:

- organizational procedures were not followed,
- there was human error,
- or another administrative explanation exists.

OVERALL ASSESSMENT

Overall Assessment

The technical evidence demonstrates:

- ✓ Account remained active after employment ended.
- ✓ Password change alone did not revoke access.
- ✓ Former employee successfully accessed official email after employment ended.
- ✓ Account suspension immediately prevented further access.
- ✓ Subsequent login attempts failed.

The audit therefore concludes that the security controls became effective only after account suspension on 4 June.

REMIEDIATION PROGRAMME

Recommendations

Immediate Recommendations

01 Implement Formal Offboarding SOP

Every employee departure should follow a documented checklist approved by:

- HR
 - IT
 - Information Security
 - Department Head
-

02 Suspend Accounts Immediately

On the employee's final working day:

- Disable account
 - Disable Active Directory
 - Disable VPN
 - Disable ERP
 - Disable SSO
 - Disable cloud applications
-

03 Force Global Sign-Out

Immediately revoke:

- Active sessions
 - Refresh tokens
 - OAuth tokens
 - Exchange sessions
 - Teams sessions
 - Mobile sessions
-

04 Remove Authentication Methods

Immediately remove:

- Password recovery methods
 - Alternate emails
 - Phone numbers
 - Authenticator apps
 - Passkeys
 - MFA devices
-

05 Remove Mobile Devices

Immediately:

- Delete enrolled devices
- Block synchronization
- Remove Exchange ActiveSync

06 Preserve Evidence

Retain:

- audit logs,
- email logs,
- Exchange logs,
- Entra ID logs,
- sign-in logs,
- mailbox activity logs

for any future legal or disciplinary proceedings.

07 Introduce Four-Eyes Approval

User account deactivation should require verification by both:

- HR, and
- Information Security or IT management.

08 Quarterly IAM Audits

Conduct periodic reviews to identify:

- dormant accounts,
- orphaned accounts,
- unauthorized privileged accounts,
- inactive devices,
- stale authentication methods.

09 Security Awareness for Administrators

Administrators should receive training that password changes alone are not an adequate offboarding measure. Standard practice should include immediate account suspension, revocation of sessions and tokens, removal of authentication methods, and device de-registration.

CONCLUSION

Conclusion

The available technical evidence indicates that the organization's offboarding process was not executed in accordance with cybersecurity best practices. Although management intended to revoke access after Mr. Zaman's departure, the initial action of changing the password did not effectively terminate access, allowing the former employee to regain entry after his employment had ended.

Once the account was suspended on 4 June, all subsequent login attempts were successfully blocked, demonstrating that account suspension, not password change, was the effective security control. The inconsistent handling of Mr. Zaman's account compared with other departing employees warrants management review to determine why established offboarding practices were not applied in this case. The audit does not attribute motive or intent; however, it concludes that the delays in access revocation exposed the organization to avoidable operational, reputational, and security risks.

Source: supplied document "Kinnaird report.docx". The audit does not attribute motive or intent.

SECTION III - TECHNICAL ASSURANCE

External Penetration Test Report

kinnaird.edu.pk

Subdomain Security Assessment

ASSESSMENT OUTCOME

Critical exposure identified - immediate containment required

PREPARED BY Zeeshan

ASSESSMENT WINDOW 24-26 July 2026

REPORT DATE 26 July 2026

DISTRIBUTION Internal Use Only

The following pages reproduce the complete supplied external penetration test from its Document Control page onward. The original technical findings, evidence, CVE mapping, recommendations and appendix are retained.

REPORT GOVERNANCE

Document Control and Contents

Classification, assessment basis, distribution and report navigation.

TARGET kinnaird.edu.pk and responsive subdomains	CLASSIFICATION Confidential - authorised recipients only
PREPARED BY Zeeshan	DISTRIBUTION Internal Use Only
ASSESSMENT DATES 24-26 July 2026	PRIMARY METHODOLOGY External assessment with manual validation

1	Executive Summary Risk posture, key findings and immediate actions	3
2	Scope & Methodology Hosts, tools and assessment approach	5
3	Findings Finding index, evidence and recommendations	6
4	CVE Mapping Version correlation and validation boundaries	29
5	Risk Summary Reported severity totals and affected areas	32
6	Prioritised Remediation 24-hour, one-week and ongoing actions	33
7	Conclusion Assessment outcome and follow-up priorities	35
A	Appendix Discovered live hosts and report closure	36

SECTION 1

Executive Summary

Management assessment of material exposure and required action.

A comprehensive external security assessment was conducted against the live subdomains of kinnaird.edu.pk from 24-26 July 2026. Testing combined automated scanning with manual validation, covering 25+ live hosts identified during reconnaissance.

1	2	9	6	1	3
CRITICAL	HIGH	MEDIUM	LOW	INFORMATIONAL	POSITIVE CONTROLS

REPORTED SEVERITY PROFILE

Severity counts follow the supplied report's Risk Summary. Positive controls are also highlighted separately in this redesign.

Immediate risk: The critical vulnerability could allow an attacker to exfiltrate or modify sensitive data, escalate privileges, and potentially execute arbitrary code. Immediate remediation is required.

IMMEDIATE MANAGEMENT ACTIONS - WITHIN 24 HOURS

Contain the confirmed critical exposure

01 - Credential rotation
Change the MySQL root password immediately.

02 - Access restriction
Limit phpMyAdmin to authorised source networks.

03 - Exposure reduction
Remove public configuration and version files.

ASSESSMENT BOUNDARY

This engagement was an external penetration test, not a forensic breach investigation. It identifies confirmed security weaknesses and potential paths to data compromise; it does not establish whether historical unauthorised access or data exfiltration occurred.

Executive Summary continued

Finding highlights

KEY FINDINGS

CRITICAL (1)	A publicly accessible phpMyAdmin instance with default credentials (root:root) on journals.kinnaird.edu.pk, granting full database access and file-write privileges.
HIGH (2)	Exposed configuration files (composer.json, package.json) and version disclosure (ResourceSpace SVN 11.0, DSpace) on several subdomains.
MEDIUM (9)	Missing security headers, no rate-limiting, exposed sensitive directories, Tomcat disclosure, an insecure session cookie, eduVPN disclosure, outdated WordPress, EOL IIS/Windows hosts, outdated jQuery and an exposed WordPress admin surface.
LOW (6)	Improper eduVPN status handling, absent HSTS, outdated Apache and potential BREACH exposure, together with positive TLS, firewall and header controls recorded in the supplied summary.
INFO (1)	The /ping command-injection concern on audio.kinnaird.edu.pk was confirmed as a false positive through time-based testing.

Assessment context

Testing combined automated scanning with manual validation across 25+ live hosts. The primary site was additionally assessed with Invicti.

CONTROL STRENGTHS OBSERVED

Strong TLS

Secure TLS 1.2/1.3 and strong ciphers on journals.

Filtered management ports

Wazuh API and management services are not internet-reachable.

Header reference baseline

Altcha demonstrates the desired security-header configuration.

This report incorporates findings from two testing rounds conducted on 24-26 July 2026.

SECTION 2

Scope & Methodology

Assessment scope, tools, validation approach and limitations.

2.1 SCOPE

Responsive external attack surface

All subdomains of kinnaird.edu.pk that responded to HTTP/HTTPS. A total of 25 live subdomains were discovered and tested. The primary (apex) site kinnaird.edu.pk was additionally assessed with Invicti.

COVERAGE

25+ live hosts

Public HTTP/HTTPS services discovered during reconnaissance and validated for reachability.

2.2 TOOLS USED

CATEGORY	TOOLS
Reconnaissance	sublist3r, subfinder, amass, dnsrecon
Live Host Check	httpx
Directory Enumeration	gobuster
Vulnerability Scanning	nuclei, wpscan, sqlmap, Invicti (Netsparker)
Manual Validation	curl, hydra, nmap, sslscan, testssl.sh, nikto, whatweb, searchsploit

2.3 APPROACH

1 Passive / active subdomain discovery Search engines, DNS and certificate transparency.	2 Live host validation HTTP/HTTPS response-code and reachability checks.
3 Automated scanning Gobuster for paths, nuclei for CVEs and wpscan for WordPress.	4 Manual verification Candidate vulnerabilities confirmed with targeted commands.
5 OWASP Top 10 (2021) oriented testing Coverage included IDOR, injection, security misconfiguration and authentication flaws.	

SECTION 3

Findings Index

Register of validated findings, control observations and assessment notes.

ID	RATING	FINDING	AFFECTED SYSTEM / ENDPOINT
3.1	CRITICAL	phpMyAdmin with Default Credentials	journals.kinnaird.edu.pk/phpmyadmin/
3.2	HIGH	Exposed Configuration and Version Information	archives.kinnaird.edu.pk
3.3	MEDIUM	Missing Security Headers	repository.kinnaird.edu.pk
3.4	MEDIUM	No Rate-Limiting on Login	archives.kinnaird.edu.pk/login.php
3.5	MEDIUM	Exposed Sensitive Directories	audio.kinnaird.edu.pk
3.6	MEDIUM	Session Cookie Missing Secure Flag	journals.kinnaird.edu.pk
3.7	INFORMATIONAL	/ping Command Injection - False Positive Confirmed	audio.kinnaird.edu.pk
3.8	POSITIVE CONTROL	Strong SSL/TLS Configuration	journals.kinnaird.edu.pk
3.9	MEDIUM	eduVPN Version Disclosure via Public info.json	vpn.kinnaird.edu.pk
3.10	LOW	Improper HTTP 200 Status on Auth-Protected eduVPN Config Paths	vpn.kinnaird.edu.pk
3.11	POSITIVE CONTROL	Wazuh Management Ports Correctly Firewalled	wazuh.kinnaird.edu.pk
3.12	MEDIUM	Out-of-date WordPress Core on Primary Site	kinnaird.edu.pk
3.13	LOW	HSTS Policy Not Enabled on Primary Domain	kinnaird.edu.pk
3.14	MEDIUM	End-of-Life Web Server OS on Multiple Hosts - IIS 7.5 / Windows Server 2008 R2	helpdesk.kinnaird.edu.pk
3.15	MEDIUM	Outdated jQuery Library and Exposed Login Portal on Admissions	admissions.kinnaird.edu.pk
3.16	LOW	Outdated Apache HTTP Server Version	journals.kinnaird.edu.pk
3.17	LOW	Response Compression Enabled Over HTTPS - Potential BREACH Exposure	journals.kinnaird.edu.pk
3.18	POSITIVE CONTROL	Security Headers Correctly Configured on Altcha	altcha.kinnaird.edu.pk
3.19	ENGAGEMENT NOTE	Round 3 Automated Scan Throttled by Rate-Limiting / WAF	Multiple / engagement-wide
3.20	MEDIUM	Publicly Accessible WordPress Admin Login Without Access Controls	kinnaird.edu.pk/wp-login.php and / wp-admin

FINDING 3.1 OWASP A05, A07

CRITICAL

phpMyAdmin with Default Credentials

TARGET	journals.kinnaird.edu.pk/phpmyadmin/
VULNERABILITY	Default credentials (root:root) allowed full authentication without restriction.
IMPACT	Full database control, file read/write, potential RCE.
EVIDENCE	Gobuster discovered /phpmyadmin/. Manual login with root:root succeeded. SQL execution confirmed via SELECT USER(); and INTO OUTFILE /tmp/test.txt.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE

```
# Login with root:root (Set-Cookie confirms auth)
curl -sk -L -X POST "$BASE/phpmyadmin/index.php" \
  -d "pma_username=root&pma_password=root&server=1&target=index.php&token=$TOKEN" \
  -i | grep "Set-Cookie"
# Response: Set-Cookie: phpMyAdmin_https=... (example)

# SQL execution test
curl -sk -L -b "$CJAR" -X POST "$BASE/phpmyadmin/index.php" \
  -d "route=/sql&db=information_schema&sql_query=SELECT+USER();&token=$TOKEN&server=1&ajax_request=1"
# Response: {"redirect_flag":"1","success":false,"error":""} (query processed)

# File write test
curl -sk -L -b "$CJAR" \
  "$BASE/phpmyadmin/index.php?route=/sql&db=information_schema&sql_query=SELECT+'TEST'+INTO+OUTFILE+' /tmp/
test.txt';&token=$TOKEN&server=1"
# File created; read back confirmed "TEST123".
```

RECOMMENDED ACTION

1. Immediately change the MySQL root password.
2. Disable or restrict phpMyAdmin to trusted IP ranges.
3. Enforce strong password policies and consider MFA.

FINDING 3.2 OWASP A06

HIGH

Exposed Configuration and Version Information

TARGETS	archives.kinnaird.edu.pk, repository.kinnaird.edu.pk
VULNERABILITY	Publicly accessible composer.json, composer.lock, package.json; version disclosure in HTML comments and error pages.
IMPACT	Attackers can identify exact software versions and plan targeted exploits.
EVIDENCE	Gobuster found /composer.json (200). HTML comment revealed ResourceSpace version SVN 11.0. robots.txt on repository revealed internal DSpace paths. Error pages on repository disclose Apache Tomcat/9.0.58 (Ubuntu).

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>curl -k -s https://archives.kinnaird.edu.pk/composer.json head -10 # Output: {"name":"montala/resourcespace", ...} curl -k -s https://archives.kinnaird.edu.pk/ grep "ResourceSpace version" # Output: ResourceSpace version SVN 11.0 curl -k -s https://repository.kinnaird.edu.pk/robots.txt # Output: Disallow: /admin/*, /submit, /profile, /search, ... # Error page reveals Tomcat version.</pre>

RECOMMENDED ACTION

1. Remove or restrict access to composer.json, package.json, and version-disclosing files.
2. Configure Tomcat to suppress error details and version information.

FINDING 3.3 OWASP A05

MEDIUM

Missing Security Headers

TARGETS	repository.kinnaird.edu.pk, journals.kinnaird.edu.pk, and several others.
VULNERABILITY	Missing Strict-Transport-Security, X-Content-Type-Options, and X-Frame-Options (except frame-ancestors on a few).
IMPACT	Increased risk of clickjacking, MIME-type sniffing, and protocol downgrade attacks.
EVIDENCE	curl -I showed no HSTS, no X-Content-Type-Options, and no X-Frame-Options on most hosts.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
curl -I https://repository.kinnaird.edu.pk # Output: No HSTS, no X-Content-Type-Options, no X-Frame-Options.

RECOMMENDED ACTION

1. Implement Strict-Transport-Security: max-age=31536000; includeSubDomains; preload
2. Implement X-Content-Type-Options: nosniff
3. Implement X-Frame-Options: DENY

FINDING 3.4 OWASP A07

MEDIUM

No Rate-Limiting on Login

TARGET	archives.kinnaird.edu.pk/login.php
VULNERABILITY	No account lockout or rate-limiting after multiple failed login attempts.
IMPACT	Susceptible to brute-force attacks.
EVIDENCE	5 consecutive failed attempts all returned HTTP 200 (no 429 or lockout).

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE

```
for i in {1..5}; do
  curl -s -o /dev/null -w "attempt $i: %{http_code}\n" \
    -X POST "https://archives.kinnaird.edu.pk/login.php" \
    -d "username=admin&password=wrong$i&Submit=Log+in"
done
# Output: attempt 1: 200, attempt 2: 200, ... attempt 5: 200
```

RECOMMENDED ACTION

1. Implement rate-limiting (e.g., 5 attempts per minute) and account lockout after 5 failures.

FINDING 3.5 OWASP A05

MEDIUM

Exposed Sensitive Directories

TARGET	audio.kinnaird.edu.pk
VULNERABILITY	config/, upload/, login/ directories are publicly accessible (301/200).
IMPACT	Attackers may find configuration files, upload endpoints, or login pages to exploit.
EVIDENCE	Gobuster scan found /config/, /upload/, /login/ (Status: 301/200).

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>gobuster dir -u https://audio.kinnaird.edu.pk \ -w /usr/share/wordlists/dirb/common.txt -x php,html,txt -t 30 -k # Output: config (Status: 301), upload (Status: 301), login (Status: 301)</pre>

RECOMMENDED ACTION

1. Restrict access using .htaccess or web server configuration. 2. Ensure these directories do not contain sensitive files.

FINDING 3.6 OWASP A07

MEDIUM

Session Cookie Missing Secure Flag

TARGET	journals.kinnaird.edu.pk
VULNERABILITY	The OJSSID session cookie lacks the Secure flag, allowing transmission over unencrypted HTTP.
IMPACT	Session hijacking risk if an attacker can intercept HTTP traffic (e.g., via man-in-the-middle).
EVIDENCE	curl -I showed Set-Cookie: OJSSID=...; httponly; samesite=lax but no Secure.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
curl -I https://journals.kinnaird.edu.pk grep -i "set-cookie" # Output: OJSSID=...; httponly; samesite=lax (missing Secure)

RECOMMENDED ACTION

1. Add the Secure flag to all session cookies and enforce HTTPS for all pages.

FINDING 3.7 OWASP A03

INFORMATIONAL

/ping Command Injection - False Positive Confirmed

TARGET	audio.kinnaird.edu.pk
ORIGINAL ASSESSMENT	Potential command injection via /ping endpoint returning {"success":true} for payloads ;id, id, and &&id.
ROUND 2 VALIDATION	Time-based blind testing performed. Baseline response: ~0.34s. Semicolon injection: ~0.28s. Pipe injection: ~0.28s. AND injection: ~0.28s. No measurable delay observed across any payload - sleep injection did not execute.
CONCLUSION	Input is being sanitised server-side or the success response is static. No command injection confirmed. Downgraded from Low to Informational / False Positive.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre># Baseline timing time curl -sk "https://audio.kinnaird.edu.pk/ping?host=127.0.0.1" # real 0m0.340s # Semicolon injection - no delay time curl -sk "https://audio.kinnaird.edu.pk/ping?host=127.0.0.1%3Bsleep%205" # real 0m0.281s # Pipe injection - no delay time curl -sk "https://audio.kinnaird.edu.pk/ping?host=127.0.0.1%7Csleep%205" # real 0m0.277s # AND injection - no delay time curl -sk "https://audio.kinnaird.edu.pk/ping?host=127.0.0.1%26%26sleep%205" # real 0m0.284s # All payloads returned same response time as baseline - sleep not executing</pre>

RECOMMENDED ACTION

1. No remediation required. Close finding. Endpoint appears to sanitise input correctly.

FINDING 3.8 OWASP A02 REPORTED AS LOW / POSITIVE FINDING

CONTROL OBSERVATION

Strong SSL/TLS Configuration

TARGET	journals.kinnaird.edu.pk
FINDING	TLS 1.2/1.3 with strong ciphers (grade A).
IMPACT	No vulnerability; positive finding.
EVIDENCE	ssllscan and nmap showed only secure protocols and ciphers.

RECOMMENDED ACTION

1. Maintain current configuration.

FINDING 3.9 OWASP A05

MEDIUM

eduVPN Version Disclosure via Public info.json

TARGET	vpn.kinnaird.edu.pk
VULNERABILITY	The /vpn-user-portal/info.json endpoint is publicly accessible without authentication and discloses the exact eduVPN version, API endpoint URLs, and OAuth/token endpoint paths.
IMPACT	An attacker can identify the exact software version and map it to known CVEs. The OAuth and API endpoint disclosure also provides a precise attack surface map without any further reconnaissance.
EVIDENCE	GET /vpn-user-portal/info.json returned HTTP 200 with the following JSON body confirming version 3.15.2-1+debian+12+1 and all API endpoint paths.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE

```
curl -sk "https://vpn.kinnaird.edu.pk/vpn-user-portal/info.json" | python3 -m json.tool
# Output:
{
  "api": {
    "http://eduvpn.org/api#3": {
      "api_endpoint": "https://vpn.kinnaird.edu.pk/vpn-user-portal/api/v3",
      "authorization_endpoint": "https://vpn.kinnaird.edu.pk/vpn-user-portal/oauth/authorize",
      "token_endpoint": "https://vpn.kinnaird.edu.pk/vpn-user-portal/oauth/token"
    }
  },
  "v": "3.15.2-1+debian+12+1"
}
```

RECOMMENDED ACTION

1. Restrict access to /vpn-user-portal/info.json via Apache/nginx configuration or require authentication.
2. Monitor eduVPN security advisories at <https://www.eduvpn.org/security/> for vulnerabilities affecting version 3.15.x.
3. If info.json must remain public (required by eduVPN clients), suppress the version field via application configuration.

FINDING 3.10 OWASP A05

LOW

Improper HTTP 200 Status on Auth-Protected eduVPN Config Paths

TARGET	vpn.kinnaird.edu.pk
VULNERABILITY	The eduVPN portal returns HTTP 200 for all requests to /vpn-user-portal/config/* regardless of authentication state, serving the login page at those paths instead of returning HTTP 401 Unauthorized or HTTP 302 Found.
IMPACT	Automated scanners and attackers receive false-positive confirmation that sensitive files exist at those paths (oauth.key, server.key, tls.key, .env, config.php). This aids reconnaissance and may cause misclassification in vulnerability management tooling. The actual file content is protected behind authentication.
EVIDENCE	All config paths probed returned HTTP 200. Manual retrieval confirmed the response body is the login page, not file content. The hidden authRedirectTo field in the login form confirms the target path exists.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE

```
# All return HTTP 200 (login page, not file content)
curl -sk -o /dev/null -w "%{http_code}" \
  "https://vpn.kinnaird.edu.pk/vpn-user-portal/config/oauth.key"
# 200
curl -sk -o /dev/null -w "%{http_code}" \
  "https://vpn.kinnaird.edu.pk/vpn-user-portal/config/server.key"
# 200
curl -sk -o /dev/null -w "%{http_code}" \
  "https://vpn.kinnaird.edu.pk/vpn-user-portal/config/tls.key"
# 200
curl -sk -o /dev/null -w "%{http_code}" \
  "https://vpn.kinnaird.edu.pk/vpn-user-portal/config/.env"
# 200

# Login page returned as body - authRedirectTo confirms path exists
# <input type="hidden" name="authRedirectTo"
#   value="https://vpn.kinnaird.edu.pk/vpn-user-portal/config/oauth.key">
```

RECOMMENDED ACTION

1. Configure the web server (Apache/nginx) to return HTTP 401 or 403 for /vpn-user-portal/config/* when the request is unauthenticated.
2. Consider blocking direct web access to the config directory entirely via Apache .htaccess or nginx location block.
3. Confirm the /vpn-user-portal/config/ directory is not accidentally web-accessible in a future eduVPN upgrade.

FINDING 3.11 OWASP A05

CONTROL OBSERVATION

Wazuh Management Ports Correctly Firewallled

TARGET	wazuh.kinnaird.edu.pk
FINDING	Wazuh API (55000), agent enrollment (1515), agent communication (1514), and Elasticsearch/OpenSearch (9200) ports are all filtered and not reachable from the internet. Only ports 80 and 443 are externally accessible, running the Wazuh dashboard.
IMPACT	No vulnerability. Correctly implemented network-level access control prevents external attackers from interacting with the Wazuh API, enrolling rogue agents, or querying the underlying Elasticsearch data store.
EVIDENCE	nmap scan confirmed filtered state on all sensitive ports. Default credential tests against port 55000 returned HTTP 000 (connection refused).

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>nmap -sV -p 443,80,55000,1514,1515,9200 wazuh.kinnaird.edu.pk # PORT STATE SERVICE # 80/tcp open http (Golang net/http) # 443/tcp open ssl (Golang net/http) # 1514/tcp filtered fujitsu-dtcns # 1515/tcp filtered ifor-protocol # 9200/tcp filtered wap-wsp # 55000/tcp filtered unknown curl -sk -u admin:admin \ "https://wazuh.kinnaird.edu.pk:55000/security/user/authenticate" # HTTP:000 - connection refused externally</pre>

RECOMMENDED ACTION

1. Maintain current firewall rules. Periodically re-verify that management ports remain filtered, especially after infrastructure changes or Wazuh upgrades.

FINDING 3.12 OWASP A06

MEDIUM

Out-of-date WordPress Core on Primary Site

TARGET	kinnaird.edu.pk (primary/apex site - WordPress)
VULNERABILITY	The primary institutional website runs an out-of-date WordPress core. The installed version lags the current stable release, exposing the site to publicly documented core vulnerabilities.
IMPACT	Outdated WordPress core is one of the most commonly exploited entry points on public sites. Depending on the exact version, known CVEs may permit authentication bypass, SQL injection, stored XSS, or remote code execution. The disclosed version also lets an attacker map directly to public exploits without further reconnaissance.
EVIDENCE	Invicti (confirmed finding) flagged "Out-of-date Version (WordPress)" on GET https://kinnaird.edu.pk/. The core version was fingerprinted via the generator meta tag / readme.html.
SEVERITY NOTE	Rated Medium pending confirmation of the exact build. If the running version maps to known remotely exploitable core CVEs (auth bypass / RCE), escalate to High or Critical and prioritise accordingly.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>curl -s https://kinnaird.edu.pk/ grep -i 'meta name="generator"' # <meta name="generator" content="WordPress X.Y.Z" /> curl -s https://kinnaird.edu.pk/readme.html grep -i version # Confirm exact core version wpscan --url https://kinnaird.edu.pk --enumerate vp,vt --no-update # Enumerate vulnerable plugins/themes and cross-reference the WP vulnerability DB</pre>

RECOMMENDED ACTION

1. Update WordPress core to the latest stable release immediately, and enable automatic background updates for minor/security releases. 2. Confirm the exact running version (wpscan) and cross-reference the WordPress vulnerability database; if it maps to known auth-bypass or RCE CVEs, treat as High/Critical. 3. Update all plugins and themes to current versions; remove any that are unused or abandoned. 4. Suppress version disclosure (remove the generator meta tag, restrict access to /readme.html) as defence-in-depth - this reduces fingerprinting but does not replace patching.

FINDING 3.13 OWASP A05

LOW

HSTS Policy Not Enabled on Primary Domain

TARGET	kinnaird.edu.pk (primary/apex site)
VULNERABILITY	The primary site does not send the HTTP Strict-Transport-Security (HSTS) response header, so browsers are not instructed to enforce HTTPS on subsequent connections.
IMPACT	Without HSTS the site is exposed to SSL-stripping and protocol-downgrade man-in-the-middle attacks, where an attacker forces the client onto plaintext HTTP. This complements the broader missing-header finding in Section 3.3, which covers the subdomains.
EVIDENCE	Invicti (confirmed finding) flagged "HTTP Strict Transport Security (HSTS) Policy Not Enabled" on GET https://kinnaird.edu.pk/. A curl of the response headers returns no Strict-Transport-Security header.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>curl -sI https://kinnaird.edu.pk/ grep -i strict-transport-security # (no output - HSTS header absent)</pre>

RECOMMENDED ACTION

1. Add the header: Strict-Transport-Security: max-age=31536000; includeSubDomains; preload
2. Apply it at the web server / CDN edge layer so it survives CMS, theme, and plugin updates.
3. Only submit to the HSTS preload list once includeSubDomains is confirmed safe for every subdomain, since several subdomains in this assessment serve distinct applications.

FINDING 3.14 OWASP A06

MEDIUM

End-of-Life Web Server OS on Multiple Hosts - IIS 7.5 / Windows Server 2008 R2

TARGETS	helpdesk.kinnaird.edu.pk (202.142.187.171), cms.kinnaird.edu.pk (111.68.105.181), social.kinnaird.edu.pk (202.142.187.171)
VULNERABILITY	All three hosts run Microsoft-IIS/7.5, which ships only with Windows Server 2008 R2. Both the web server and the underlying OS are end-of-life: Windows Server 2008 R2 extended support ended 14 January 2020, so no security patches have been issued for over six years.
IMPACT	An unpatched, internet-facing server accumulates every OS- and IIS-level vulnerability disclosed since 2020 with no vendor fix available. Even though the sites currently serve default "Under Construction" pages, the hosts remain exploitable at the platform layer and represent a standing foothold risk. This is a platform-lifecycle finding independent of the application content.
EVIDENCE	whatweb fingerprinted all three as Microsoft-IIS/7.5 with X-Powered-By: ASP.NET. nmap -sV against helpdesk confirmed IIS httpd 7.5 on port 80 and Service Info OS: Windows. IIS 7.5 maps uniquely to Windows Server 2008 R2.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>whatweb -a 3 https://helpdesk.kinnaird.edu.pk # HTTPServer[Microsoft-IIS/7.5], X-Powered-By[ASP.NET], Title[IIS7] nmap -Pn -sV -p 80,443 helpdesk.kinnaird.edu.pk # 80/tcp open http Microsoft IIS httpd 7.5 # Service Info: OS: Windows; CPE: cpe:/o:microsoft:windows</pre>

RECOMMENDED ACTION

1. Migrate all three hosts to a supported OS and web server (Windows Server 2022/2025 with a current IIS, or a maintained Linux/Apache/nginx stack).
2. If the sites are genuinely inactive ("Under Construction"), take them offline or behind authentication until they are ready, to reduce external attack surface.
3. Confirm the shared host at 202.142.187.171 (helpdesk and social) is fully patched at the OS layer, since a single compromise there affects both names.

FINDING 3.15 OWASP A06, A07

MEDIUM

Outdated jQuery Library and Exposed Login Portal on Admissions

TARGET	admissions.kinnaird.edu.pk (202.142.187.166)
VULNERABILITY	The admissions portal (IIS 10, ASP.NET 4.0.30319) loads jQuery 1.6.1, released in 2011. This version predates numerous fixed client-side XSS issues. The page also exposes a live authentication form (password field txtUserPassword) directly to the internet.
IMPACT	Outdated jQuery exposes users of the portal to known DOM-based / reflected XSS vectors if application code passes untrusted input through the affected sinks. The exposed login form, combined with the lack of rate-limiting observed elsewhere in this engagement (Section 3.4), makes the portal a candidate for credential brute-force and phishing. Session cookie is set with HttpOnly (positive), but the jQuery and login exposure remain.
IMPACT DETAIL	Because this is a real applicant-facing login (not a placeholder), a successful attack here has a direct path to personal data - a higher business impact than the placeholder subdomains.
EVIDENCE	whatweb -a 3 fingerprinted JQuery[1.6.1], ASP_NET[4.0.30319], Microsoft-IIS[10.0], PasswordField[txtUserPassword], HttpOnly[ASP.NET_SessionId], and Title[KINNAIRD COLLEGE FOR WOMEN]. The Google Analytics tag (UA-45313532-1) and Meta-Author[Colorlib] were also disclosed.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
whatweb -a 3 https://admissions.kinnaird.edu.pk # JQuery[1.6.1], ASP_NET[4.0.30319], Microsoft-IIS[10.0], # PasswordField[txtUserPassword], HttpOnly[ASP.NET_SessionId]

Finding 3.15 continued

Related CVEs and remediation

RELATED CVES (JQUERY 1.6.1)

CVE	DETAIL
CVE-2011-4969	XSS via location.hash element selection; fixed in jQuery 1.6.3. 1.6.1 is affected.
CVE-2012-6708	XSS - jQuery(strInput) does not reliably distinguish selectors from HTML; fixed in 1.9.0. 1.6.1 is affected.
CVE-2015-9251	XSS via cross-domain Ajax responses executed as text/javascript; fixed in 3.0.0. 1.6.1 is affected.
CVE-2019-11358	Prototype pollution via jQuery.extend(true, ...); fixed in 3.4.0. 1.6.1 is affected.
CVE-2020-11022 / CVE-2020-11023	XSS from HTML from untrusted sources passed to DOM manipulation methods; affects 1.2 up to before 3.5.0. 1.6.1 is affected.

Exploitability note. These are library-level CVEs. Exploitability depends on whether the application actually passes attacker-controlled input through the affected jQuery sinks; this should be confirmed by manual XSS testing of the portal before the finding is treated as directly exploitable. The version exposure and patch-currency gap stand regardless.

RECOMMENDED ACTION

1. Upgrade jQuery to a current 3.x release (3.5.0 or later) to clear all listed CVEs.
2. Apply rate-limiting and account lockout to the admissions login form, as recommended for archives and journals in Section 3.4.
3. Manually test the portal for reflected/DOM XSS and confirm the login enforces HTTPS end-to-end.

FINDING 3.16 OWASP A06

LOW

Outdated Apache HTTP Server Version

TARGETS	journals.kinnaird.edu.pk, altcha.kinnaird.edu.pk
VULNERABILITY	Both hosts run Apache/2.4.58 (Ubuntu). Nikto flagged this as outdated (the 2.4.x branch has since advanced to 2.4.66+), meaning several months of Apache security fixes are unapplied.
IMPACT	Running a back-level Apache exposes the hosts to any vulnerabilities patched in intervening 2.4.x releases and discloses the exact version to attackers via the Server header. Low severity absent a confirmed exploitable CVE, but relevant to patch hygiene.
EVIDENCE	nikto reported: "Apache/2.4.58 appears to be outdated (current is at least 2.4.66)." The Server: Apache/2.4.58 (Ubuntu) header is returned on both hosts.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>curl -skI https://journals.kinnaird.edu.pk/ grep -i server # Server: Apache/2.4.58 (Ubuntu)</pre>

RECOMMENDED ACTION

1. Apply the latest distribution security updates so Apache is patched to the current 2.4.x line.
2. Optionally set ServerTokens Prod / ServerSignature Off to reduce version disclosure.

FINDING 3.17 OWASP A02

LOW

Response Compression Enabled Over HTTPS - Potential BREACH Exposure

TARGET	journals.kinnaird.edu.pk
VULNERABILITY	The server returns responses with Content-Encoding: deflate over HTTPS. Nikto flags this as a potential BREACH condition.
IMPACT	BREACH is a theoretical compression-based side-channel that can, under specific conditions (attacker-influenced request reflected into a compressed response containing a secret such as a CSRF token, plus the ability to observe response sizes), recover small secrets. Exploitation is difficult and situational, so this is Low / often accepted-risk rather than a confirmed vulnerability.
EVIDENCE	nikto reported: the Content-Encoding header is set to "deflate" which may indicate BREACH exposure. This is a heuristic flag, not a confirmed exploit.

RECOMMENDED ACTION

1. Treat as accepted risk unless the application reflects user input into compressed responses that also contain secrets.
2. Where sensitive tokens are served, consider disabling compression on those specific responses or masking/rotating CSRF tokens per request.

FINDING 3.18 OWASP A05

CONTROL OBSERVATION

Security Headers Correctly Configured on Altcha

TARGET	altcha.kinnaird.edu.pk (Apache/2.4.58, Ubuntu)
OBSERVATION	Unlike most subdomains in Section 3.3, the altcha host correctly sets Strict-Transport-Security (max-age=2592000; includeSubDomains), X-Frame-Options: SAMEORIGIN, X-Content-Type-Options, and Referrer-Policy.
SIGNIFICANCE	This host demonstrates the desired header baseline and can serve as the internal reference configuration when remediating the other subdomains. A positive control, recorded alongside the strong TLS (Section 3.8) and Wazuh firewalling (Section 3.11) findings.
EVIDENCE	whatweb -a 3 reported Strict-Transport-Security[max-age=2592000; includeSubDomains], X-Frame-Options[SAMEORIGIN], and x-content-type-options among the returned headers.

RECOMMENDED ACTION

1. Use the altcha header configuration as the template to roll out across the remaining subdomains and the primary site.

FINDING 3.19 OWASP A06

ASSESSMENT NOTE

Round 3 Automated Scan Throttled by Rate-Limiting / WAF

OBSERVATION	A broad automated nuclei sweep across all hosts triggered active rate-limiting on the target infrastructure. Nearly all requests subsequently returned connection timeouts ("port closed or filtered"), and rate-limit headers (x-ratelimit-limit: 100, x-ratelimit-remaining, x-ratelimit-reset-in) were observed on responses. Hosts that responded normally to low-rate manual requests moments earlier were dropped during the sweep.
INTERPRETATION	The nuclei round-3 output contains no reliable findings and was discarded. Importantly, the throttling itself is a defensive positive: the infrastructure detected and shaped high-volume automated traffic. Manual, low-rate verification (single curl / nmap requests) continued to succeed, confirming the block was rate-based, not a hard IP ban.
FOLLOW-UP	Any future automated scanning should run at a reduced rate (e.g. nuclei -rl 10 -c 5), one host at a time, ideally with the testing source IP whitelisted by Kinnaird IT for the engagement window.

FINDING 3.20 OWASP A05, A07

MEDIUM

Publicly Accessible WordPress Admin Login Without Access Controls

TARGET	kinnaird.edu.pk/wp-login.php and /wp-admin (primary/apex site)
VULNERABILITY	The WordPress administrative login is reachable from any source IP with no network-layer restriction. User registration is enabled (/wp-login.php?action=register returns HTTP 200), and the login page shows "No apps configured. Please contact your administrator." - indicating an MFA/authentication-app plugin is installed but not configured, so multi-factor authentication is not enforced.
VULNERABILITY DETAIL	WordPress exposes /wp-login.php publicly by default; this is not a defect in WordPress itself but a missing hardening control. Restricting the admin login to trusted networks (edge IP allowlisting, a Zero Trust / WAF access policy, HTTP auth, or a changed login path) is a standard, expected control for an internet-facing administrative interface and is absent here.
IMPACT	The primary site's administrative authentication is exposed to internet-wide brute-force and credential-stuffing. The risk is compounded by three factors already documented in this report: the out-of-date WordPress core (Section 3.12), the absence of rate-limiting / account lockout observed on other login forms in this engagement (Section 3.4), and now confirmed open registration. Open self-registration on an admin surface can also grant unintended access depending on the default role and any registration-aware plugins.
EVIDENCE	The login page (Figure: WordPress login on kinnaird.edu.pk) is served publicly with Register and Lost-password links and the unconfigured-MFA notice. curl confirmed the registration endpoint is live: HTTP/2 200 on GET /wp-login.php?action=register.

TECHNICAL VALIDATION EVIDENCE

VALIDATED EVIDENCE
<pre>curl -sKI "https://kinnaird.edu.pk/wp-login.php?action=register" head -1 # HTTP/2 200 (registration page reachable - self-registration enabled) curl -sKI "https://kinnaird.edu.pk/wp-login.php" head -1 # 200 - admin login publicly reachable, no network restriction</pre>

Finding 3.20 continued

Access-control remediation

RECOMMENDED ACTION

1. Restrict /wp-login.php and /wp-admin at the network edge - IP allowlisting or a Zero Trust / WAF access policy so only trusted sources reach the admin login. (A Cloudflare Access policy gated behind a WARP-authenticated tenant, allowing only enrolled users to reach the critical pages, is a suitable reference pattern.)
2. Disable open user registration unless it is a deliberate requirement; if registration is needed, confirm the default role grants no administrative capability.
3. Enforce MFA for all administrative accounts and complete the configuration of the installed authentication-app plugin.
4. Add rate-limiting and account lockout on the login form, consistent with the recommendation for archives and journals (Section 3.4).
5. Combine with the core/plugin/theme updates in Section 3.12 so the platform is both patched and access-restricted.

SECTION 4

CVE / Known Vulnerability Mapping

Version correlation and validation boundaries for publicly referenced vulnerabilities.

The software and version banners disclosed during reconnaissance (Section 3.2) allow the corresponding public CVE records to be correlated. This helps the client understand what a real-world attacker could look up and attempt against these hosts without any further reconnaissance. Exact patch levels were not confirmed via authenticated inspection, so entries below should be validated against the live build before remediation is prioritised. Confirmed-version entries (IIS 7.5, jQuery 1.6.1, Apache 2.4.58) are distinguished below from banner-only entries; the closing VERIFICATION STATUS item lists exploits that do NOT apply to the observed versions and must not be reported as live without version confirmation.

Apache Tomcat 9.0.58Banner/version correlation repository.kinnaird.edu.pk	
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION CVE-2023-44487 (HTTP/2 Rapid Reset DoS) CVE-2023-46589 / CVE-2023-45648 (request smuggling) CVE-2024-50379 / CVE-2024-56337 (RCE via write-enabled Default Servlet)	NOTES AND VALIDATION CONTEXT 9.0.58 predates dozens of subsequent security fixes (current patched line is 9.0.120+). The RCE entries require write-enabled default servlet + case-insensitive filesystem to be exploitable; the DoS and smuggling issues apply more broadly. Upgrade rather than patch individual CVEs.
ResourceSpace "SVN 11.0"Banner-only; validate build archives.kinnaird.edu.pk	
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION CVE-2021-41765 (pre-auth SQL injection to RCE) CVE-2021-41950 (path traversal) CVE-2021-41951 (reflected XSS) CVE-2015-3648 (local file inclusion)	NOTES AND VALIDATION CONTEXT The banner does not indicate whether the specific SVN 11.0 build post-dates the vendor patches for these issues. Recommend confirming the exact release/patch level directly with the system owner and applying the latest Montala ResourceSpace security updates.
DSpaceVersion not disclosed repository.kinnaird.edu.pk	
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION CVE-2025-53621 / CVE-2025-53622 (XXE and path traversal via Simple Archive Format import) CVE-2024-38364 (stored XSS via bitstream download)	NOTES AND VALIDATION CONTEXT Exact DSpace version was not disclosed by the target during this assessment. The XXE/path-traversal issues require administrator-level access to exploit; the XSS issue requires submitter privileges. Confirm installed version and apply vendor patches.

phpMyAdmin default credentials journals.kinnaird.edu.pk		Confirmed configuration weakness
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION No CVE applies - this is a configuration weakness (CWE-521 / CWE-798: use of default/hard-coded credentials), not a software defect.	NOTES AND VALIDATION CONTEXT Remediation is credential rotation and access restriction (Section 3.1), not vendor patching.	
eduVPN 3.15.2 vpn.kinnaird.edu.pk		No confirmed CVE at assessment time
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION No CVEs confirmed for 3.15.2 at time of testing. Historical: CVE-2022-36440 affected older 2.x portal versions (auth bypass). Version 3.x line is the current supported branch. CWE-200: Information Exposure applies to the public info.json disclosure.	NOTES AND VALIDATION CONTEXT 3.15.2 is a recent Debian-packaged build. No known critical CVEs at time of assessment. Monitor eduVPN security advisories at https://www.eduvpn.org/security/ for future advisories. The info.json disclosure is a configuration issue, not a software defect.	
WordPress core (out of date) kinnaird.edu.pk - primary site		Exact build not confirmed
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION Version-specific - confirm exact build first. WordPress core has a long history of high-impact CVEs (auth bypass, SQLi, stored XSS, and RCE via chained flaws).	NOTES AND VALIDATION CONTEXT The exact version was not confirmed by authenticated inspection. Run wpscan to fingerprint core + plugins/themes, then map to the WordPress vulnerability database (wpscan.com/wordpresses). Escalate severity to High/Critical if the build matches known remotely exploitable CVEs.	
Microsoft IIS 7.5 / Windows Server 2008 R2 helpdesk, cms, social		Confirmed EOL platform
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION Platform EOL - no single CVE; entire post-2020 Windows Server 2008 R2 / IIS 7.5 patch backlog applies. Historical examples: CVE-2015-1635 (HTTP.sys RCE, MS15-034), CVE-2017-7269 (IIS 6 WebDAV - illustrative of IIS legacy risk).	NOTES AND VALIDATION CONTEXT Confirmed via nmap -sV (IIS 7.5, OS: Windows) and whatweb. Server 2008 R2 extended support ended 14 Jan 2020. Severity driven by unsupported-platform status rather than a single CVE. Migrate to a supported OS/web server (Section 3.14).	
jQuery 1.6.1 admissions.kinnaird.edu.pk		Version confirmed
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION CVE-2011-4969, CVE-2012-6708, CVE-2015-9251, CVE-2019-11358, CVE-2020-11022, CVE-2020-11023 (client-side XSS / prototype pollution).	NOTES AND VALIDATION CONTEXT Version confirmed via whatweb banner. All listed CVEs are fixed in later 1.x/3.x releases and apply to 1.6.1. Library-level exposure; confirm exploitable sinks via manual XSS testing (Section 3.15). Upgrade to jQuery 3.5.0+.	

Apache HTTP Server 2.4.58 journals, altcha		Version confirmed
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION Version-currency gap - multiple 2.4.x security fixes released after 2.4.58 (current >= 2.4.66). Specific applicable CVEs depend on modules enabled; confirm before citing individually.	NOTES AND VALIDATION CONTEXT Confirmed via Server header and nikto. Low severity; apply distribution updates to the current 2.4.x line (Section 3.16).	

VERIFICATION STATUS - Tomcat 9.0.58 / ResourceSpace SVN 11.0 / DSpace / phpMyAdmin Validation boundary		Do not report as live without validation
REPRESENTATIVE PUBLIC CVES / CLASSIFICATION The searchsploit / public-CVE entries above these rows were NOT version-confirmed against the live builds during this engagement.	NOTES AND VALIDATION CONTEXT Several well-known exploits do NOT apply to the observed versions: Tomcat Ghostcat (CVE-2020-1938) is fixed before 9.0.31 and the JSP-upload RCE (CVE-2017-12617) before 9.0.1 - both predate 9.0.58. ResourceSpace public PoCs target 6.4.x/8.6, not SVN 11.0. phpMyAdmin version could not be fingerprinted externally. Treat all four as version-disclosure only until the exact build is confirmed by authenticated inspection.	

SECTION 5

Risk Summary

Source-reported severity profile and affected systems.

CRITICAL	1	phpMyAdmin root:root access (journals)
HIGH	2	Exposed config/version files (archives, repository); Tomcat version disclosure (repository)
MEDIUM	9	Missing security headers; no rate-limiting on login; exposed sensitive directories (audio); session cookie missing Secure flag (journals); eduVPN version + API endpoint disclosure (vpn); out-of-date WordPress core (primary site); EOL IIS 7.5 / Windows Server 2008 R2 (helpdesk, cms, social); outdated jQuery 1.6.1 + exposed login (admissions); publicly accessible WordPress admin login, open registration, MFA not enforced (primary site)
LOW	6	eduVPN improper HTTP 200 on config paths (vpn); HSTS not enabled on primary domain; strong SSL/TLS (journals) - positive; Wazuh management ports firewalled - positive; outdated Apache 2.4.58 (journals, altcha); response compression / potential BREACH (journals); security headers correctly set (altcha) - positive
INFORMATIONAL	1	/ping command injection - false positive confirmed (audio)

Positive controls noted in the report

Strong TLS on journals.kinnaird.edu.pk, filtered Wazuh management ports, and a correctly configured security-header baseline on altcha.kinnaird.edu.pk.

SECTION 6

Recommendations - Prioritised

Prioritised actions organised by required completion horizon.

Immediate

WITHIN 24 HOURS

1. Change MySQL root password for journals.kinnaird.edu.pk.
2. Disable or restrict phpMyAdmin to authorized IPs.
3. Remove public access to composer.json, package.json, and version-disclosing files.

Short-Term

WITHIN 1 WEEK

4. Implement security headers (HSTS, X-Content-Type-Options, X-Frame-Options) across all subdomains and the primary domain (kinnaird.edu.pk).
5. Enable rate-limiting and account lockout on login forms (archives, journals).
6. Restrict access to /config/, /upload/, /login/ directories (audio).
7. Add Secure flag to all session cookies (journals).
8. Configure Tomcat to suppress error details and version information (repository).
9. Restrict or suppress /vpn-user-portal/info.json on vpn.kinnaird.edu.pk to prevent version and API endpoint disclosure.
10. Configure web server to return HTTP 401/403 for /vpn-user-portal/config/* paths instead of HTTP 200 login page.

Long-Term

ONGOING

11. Update WordPress core, plugins, and themes on the primary site (kinnaird.edu.pk) to the latest stable releases; enable automatic security updates and confirm the build against the WP vulnerability database.
12. Conduct a full application-level security review of the internal applications on helpdesk, CMS, social, and admissions. These were reached and fingerprinted in round 3 (see Sections 3.14-3.15) but not exhaustively tested at the application layer.
13. Enforce strong password policies and MFA for all administrative interfaces.
14. Subscribe to security advisories for all deployed software: eduVPN (eduvpn.org/security), ResourceSpace (montala.com), DSpace (dspace.org), Apache Tomcat (tomcat.apache.org/security).
15. Regular vulnerability scanning and penetration testing on a quarterly basis.
16. Maintain current Wazuh firewall posture - re-verify management ports after any infrastructure changes.
17. Migrate the end-of-life IIS 7.5 / Windows Server 2008 R2 hosts (helpdesk, cms, social) to a supported OS and web server, or take them offline while under construction. Confirm the shared host at 202.142.187.171 is fully patched, as helpdesk and social share it.

Recommendations - Prioritised

Long-term actions continued

-
18. Upgrade jQuery on admissions.kinnaird.edu.pk from 1.6.1 to a current 3.x release (3.5.0+) and apply rate-limiting to the applicant login portal; manually test the portal for reflected/DOM XSS.
 19. Apply distribution security updates so Apache is patched to the current 2.4.x line (journals, altcha), and reduce version disclosure via ServerTokens Prod.
 20. Use the altcha host header configuration as the internal reference baseline when rolling out security headers to the other subdomains and the primary site.
 21. Whitelist the authorized testing source IP with Kinnaird IT for future engagements, and run automated scanners (nuclei) at a reduced rate to avoid the rate-limiting / WAF throttling encountered in round 3.
 22. Restrict the WordPress admin login (/wp-login.php, /wp-admin) on the primary site to trusted networks via edge IP allowlisting or a Zero Trust / WAF access policy, disable open registration, and enforce MFA - addressing the internet-facing brute-force surface in Section 3.20.

SECTION 7

Conclusion

Overall assessment judgement, assurance observations and follow-up requirements.

Across three rounds of testing conducted on 24-26 July 2026, the assessment uncovered one critical vulnerability (phpMyAdmin root:root access on journals), two high findings (exposed configuration and version disclosure on archives and repository), nine medium findings - including eduVPN version and API endpoint disclosure on the VPN portal, an out-of-date WordPress core on the primary site, three end-of-life IIS 7.5 / Windows Server 2008 R2 hosts (helpdesk, cms, social), an outdated jQuery 1.6.1 library with an exposed applicant login portal on admissions, and a publicly accessible WordPress admin login on the primary site (open registration, MFA not enforced) - and six low findings, including outdated Apache on two hosts and a potential BREACH condition on journals. A previously flagged potential command injection on audio.kinnaird.edu.pk was confirmed as a false positive via time-based blind testing and has been closed. Three positive security controls were noted: Wazuh management ports are correctly firewalled, journals.kinnaird.edu.pk maintains a strong TLS configuration, and altcha.kinnaird.edu.pk correctly implements the recommended security-header baseline.

The subdomains previously blocked by connectivity issues (helpdesk, cms, social, admissions, altcha) were reached and fingerprinted in round 3, yielding the platform and library findings above; application-level testing of these hosts should still be completed in a follow-up engagement. A broad automated scan in round 3 triggered the target's rate-limiting / WAF controls and returned no reliable data, so those hosts warrant a slower, whitelisted re-scan. Version-based CVE correlation in Section 4 distinguishes confirmed-version findings from banner-only entries; several widely known exploits (e.g. Tomcat Ghostcat and JSP-upload RCE) do not apply to the observed versions and must not be treated as live without authenticated version confirmation. The critical and high findings represent immediate risk to the organization's data and infrastructure and should be remediated before the next assessment cycle.

Decision point: The critical and high findings should be remediated before the next assessment cycle.

VALIDATED POSITIVE CONTROLS

Strong TLS

journals.kinnaird.edu.pk maintains TLS 1.2/1.3 with strong ciphers.

Network isolation

Wazuh API and management ports are filtered from the internet.

Header baseline

altcha.kinnaird.edu.pk demonstrates the recommended security-header configuration.

APPENDIX

Full Subdomain List

Responsive hosts explicitly listed in the supplied assessment.

admissions.kinnaird.edu.pk	altcha.kinnaird.edu.pk
archives.kinnaird.edu.pk	audio.kinnaird.edu.pk
